TITLE OF INVENTION: POLYNUCLEDTIDES CONTROLLING THE EXPRESSION
TITLE OF INVENTION: OF AND CODING FOR GENE B IN TOWATO AND USE
TITLE OF INVENTION: OF SAWE FOR ALTERING CAROTENOID
TITLE OF INVENTION: BIOSYNTHESIS
NUMBER OF SEQUENCES: 25
CORRESPONDENCE ADDRESS: Ask M. Friedman c/o Anthony Castorina
ADDRESSEE: Mark M. Friedman c/o Anthony Castorina
STREET: 20001 Jefferson Davis Highway, Suite 207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 498;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels

S-09-134-607A-18
Sequence 18, Application US/09134607A
Sequence 18, Application US/09134607A
Patent No. 6252141
GENERAL INFORMATION:
APPLICANT: Joseph Hirschberg et al.
TITLE OF INVENTION: POLYNUCLEGOTEDES CONTROLLING THE EXPRESSION
TITLE OF INVENTION: OF SAME FOR ALTERING CAROTENOLD
TITLE OF INVENTION: BIOSYNTHESIS
NUMBER OF SEQUENCES: 25
CORRESPONDANCE ADDRESS:
ADDRESSER: Mark M. Friedman c/o Anthony Castorina
STREET: 20001 Jefferson Davis Highway, Suite 207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astexanthin, by using microorganism having a nucleic acid molecule encoding enzymes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Carotenoid, isopentenyl pyrophosphate, antheraxanthin, astaxanthin, d:

the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii lycopene cyclase (CrtX) enzyme used in the invention

                                                The invention comprises the amino acid and coding sequence of a number o carotenoid (crt)-related proteins. The crt-related DNA and protein sequences of the invention are useful for engineering cells which are able to produce carotenoids. The present amino acid sequence represents crt-related protein of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                The present invention describes Pantoea stewartii carotenoid biosynthetic enzymes (I). More specifically described are the geranylgeranyl pyrophosphate synthase (crtE), zeaxanthin glucosyl transferase (crtX), lycopene cyclase (crtE), phytoene desauturase (crtI), phytoene synthase (crtI) and beta-carotene hydroxylase (crtZ) enzymes (see ABP96685 to carotenoid biosynthesis in an organism, by over-expressing (I) in an organism, such that the carotenoid biosynthesis is altered in the organism. (I) and the genes encoding (I) are useful for converting phytoene to the carotenoids, for creating recombinant organism that have the ability to produce various carotenoid compounds, and also for enhancing or manipulating carotenoid compounds, (I) can also be used for producing gene products having enhanced or altered activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

                                                                                                                                                                                                                               This invention describes a novel method for the preparation of carotenoids using genes and proteins isolated from Candida utilis. The invention specifically describes the isolation of a 3-hydroxy-3 methylglutaryl coenzyme A (HWG-COA) reductase protein. This sequence represents the Candida utilis crty protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtB, crtB, crtI, crtY, crtZ, crtX or are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ठे
                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes beta-carotin hydroxylase. Beta-carotene can be used in the preparation of xanthophylls and their metabolites. The present sequence represents an Erwinia uredovora crtY protein sequence from the present invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Manipulation of the DNA encoding the present sequence, lycopene cyclase, by in frame linkage to the chloroplast transit peptide (AAW01124) of the tobacco ribulose bis-phosphate carboxylase-oxygenase gene can lead to increased production of total carotemoids in the chloroplast of transformed plants as compared to native, non-transformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological synthesis of further of carotemoids such as zeaxanthin and zeaxanthin diglucoside. Other enzymes involved in the carotemoid biosynthesis pathway include geranylgearnyl pyrophosphate (AAW01119), phytoene synthase (W01121) and phytoene dehydrogenase-4H (AAW01123). (Updated on 25-MAR-2003 to correct pp field.) (Updated on 16-OCT-2003 to standardise OS field)

ö
molecule comprises at least 1125 bp and is present in the plasmids pARC147, pARC1509, pARC1510 and pARC1520. The present sequence represents lycopene cyclase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Beta-carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 22-MAR-2003 to correct PP field.) ```
There are a total of six relevant genes in a 7900 bp region that cause E. coli cells to produce GGPP and the carotemoids phytoene through zeaxanthin diglucoside, which is the final prod. identified in the carotemoid pathway contd. in plasmid pakc176 (contg. a ca. 13 kb chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168:607 (1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene debydrogenase-44! Jycopene cyclase, beta-caroteme hydroxylase, and caexanthin glycosylase are represented in AAQ13716, AAQ13718, AAQ13729, AAQ13724 and AAQ13726 crespectively. The native sequence (AAQ13722 and AAQ13724 and AAQ13726 the genetically engineered for use in expression in yeast. At the 5' end of the gene, the native initiation GTG codon has been changed to an ATG codon. The second anno acid residue, Arg, was originally encoded by an AGG codon that was changed to a CGG codon, while retaining its coding for the Arg amino acid residue. Recombinant expression plasmids can be used to produce large amis. Of the enzymes and hence large amis. of the carotemoids which they synthesise. (Updated on 25-MAR-2003 to correct PP field.) (Updated on 23-MAR-2003 to correct PP field.) (Updated on 24-OCT-
                                                                                                                                                                                                                                                                                                                    Biosynthesis of carotenoid(s) in genetically engineered hosts - using DNA encoding enzymes from Brwinia herbicola.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detection, the genome of P. Luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypepiides encoded by the genes are used for detection/identification of P. Luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. croombinant production of the proteins, particularly toxins and carticularly toxins and sensitive to P. luminescens enalthe proteins or antibiotics) and as the sensitive to P. luminescens and the proteins are as virulence factors and for identifying targets of human diseases for which P. C. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 WIAPLITYRASGYDVIFPAPQRTLPHSYFSITSQHFASILHAYLGBRIQTRLLVQBLTPQ 120

The invention describes the preparation of carotenoid pigments e.g. canthaxanthins using a cell transformed by a vector having DNA sequences (a) to or substantially homologous sequences (a) a DNA sequence (crEB) coding GSPP synthase of Flavobacterium sp. R1534; (b) a DNA sequence (crEB) coding prephytoene synthase of Flavobacterium sp. R1534; (c) a DNA sequence (crII) coding phytoene describes of Flavobacterium sp. R1534; (d) a DNA sequence (crIY) coding lycopene cyclase of Flavobacterium sp. R1534, and (e) a DNA sequence (crIY) coding lycopene cyclase of Flavobacterium sp. R1534, and (e) a DNA sequence (crIX) coding lycopene cyclase of Earoteners beca-oxygense of a microbe E-196 (FERM BP-4283). The carotenoid or a caroteme of a miscobe used in preparation of food products. The method is an improved method of fermentation for carotenoid
                                                                                                                                                                                                         242 ITLICONROFWQQQQQQC--SGLRAGLFHPTTGYSLPLAVALADRLSALDVFTSSSVHQT 299
                                                                                                                                                                                                                                                                                        IAHPAQQRWQQQGFFRMLNRMLFLAGPAESRWRVMQRFYGLPEDLIARFYAGKLTVTDRL 359

R1534. This 42368 Da protein introduces the beta-ionone rings at both sides of lycopene to obtain beta- carotene. Enzymes of the Flavobacterium carotenoid biosynthetic pathway (see also AAW06515-18 and AAW00871) can be expressed, optionally with Alcaligenes beta-carotene beta-4-oxygenase, in host cells for the prodn. of lycopene, astaxanthin, beta-carotene, echinenone, zeaxanthin, canthaxanthin and adonixanthin. These polypeptides are capable of converting the 4-methylene group of a 3-hydroxy-beta-ionone ring to a 4-keto group in doing so these peptides also add a hydroxyl group to the 3-position carbon-atom of the 4-keto-beta- ionone ring. The
